Covid vaccine may have killed hundreds of thousands in the US alone

By **Neville Hodgkinson** May 7, 2024

IS THE dam cracking at last? It may be a small leak at present, but enough to give hope that covid vaccine truths will eventually receive mass recognition.

It is more than three years since *TCW* began describing [reports of widespread and serious harm](#) from the ‘gene therapy’ experimental jab. Big money, political pressure, and the pride of scientific and medical institutions have until now discouraged most mainstream media from covering the tragic story. Doctors and scientists brave enough to counter claims that

they were peddling ‘misinformation’ by trying to alert us to the problem seemed to get nowhere.

Now the *New York Times* has run an article headlined: ‘[Thousands Believe Covid Vaccines Harmed Them. Is anyone listening?](#)’ It was written by Apoorva Mandavilli, a reporter specialising in science and global health. She spent more than a year interviewing experts in vaccine science, policymakers and people who said they had experienced serious side-effects after the jab.

The article demonstrates how injured patients, including vaccine experts themselves, were denied help by federal health officials who kept insisting – against a tide of scientific and medical evidence – that the jabs are ‘safe and effective’.

It quotes Dr Janet Woodcock, a respected US Food and Drug Administration commissioner, now retired, as acknowledging that some vaccinees experienced uncommon but ‘life-changing’ reactions beyond those described by federal agencies. ‘I feel bad for those people,’ she said.

The *Daily Mail* [picked up on the report](#), and last week [told the story](#) of how bereaved UK families have felt treated as ‘collateral damage’ in the vaccine rollout.

Mandavilli’s account still contains a genuflection at the altar of vaccine effectiveness. ‘The covid vaccines, a triumph of science and public health, are estimated to have prevented millions of hospitalisations and deaths,’ she writes. The *NYT*, previously a champion of the ‘misinformation’ claims, probably would not have published the article without such a declaration of faith.

Yet according to a fresh analysis by the former BlackRock Wall Street executive Ed Dowd, far from saving millions, the jabs may have cost hundreds of thousands of lives in the US alone.

In addition, a preprint of a huge new Cleveland Clinic [study](#) of nearly 50,000 of their employees, posted last month, which says that those who received more than one dose of the covid jab were found to be more rather than less likely to contract the illness.

Dowd, author of *Cause Unknown: The Epidemic of Sudden Deaths in 2021 and 2022*, and his team of researchers at [Phinance Technologies](#) applied statistical tools developed for financial purposes to examine data on injuries and deaths during the vaccine rollout.

He declared in a recent [interview](#) with the *Epoch Times*: ‘Every regulator, every health authority, every government should be screaming from the top of their lungs: “This is a problem. This is a national [and] global crisis. We should look into it.” But there’s silence on it, and I believe they’re silent because they know the answer.’

Since the vaccine campaign began in 2021, about 1,100,000 more Americans died than would have been expected based on previous trends. Of those, 300,000 were between the ages of 15 and 64.

Excess deaths during the pandemic year 2020 totalled 458,000, but most of those were older Americans, with only 124,000 (27 per cent) in the 15-64 age group. In 2021, the figure for that younger group rose to 215,000 (47 per cent).

‘That’s striking to me, because we were told the virus mostly killed older Americans with comorbidities. Why then was there a shift in 2021? Because an equal amount of Americans died excessively each year, but we then shifted to almost half of those Americans being of working age.’

Instead of being protected by the vaccine, the trend continued in 2021, 2022 and 2023. In addition, the statistics for disabilities ‘just really take off’ in 2021, Dowd said. For every one excess death, about four or five disabilities were reported. ‘If I was to measure the effectiveness of the vaccine just based on that alone, it’s an epic fail.’

He added that with many Americans now declining to take the booster jabs, ‘the good news is there seems to be a declining trend in excess mortality’ – though less so in disabilities. Countries which have continued the booster programme are not experiencing this decline. ‘For instance, the UK has seen a rise in excess deaths ages 15 to 44. It actually hit new highs in 2023 of around 20 per cent.’

Dowd cited his team’s analysis of excess cancer deaths in people aged 15-44 in the UK, a [study already reported in TCW](#). He said that in 2020, there was actually a slight decrease, followed by a significant increase in 2021 and an ‘off the charts’ rise in 2022. ‘Fairly shortly, we’re going to be releasing a similar study done in the US using CDC [Centers for Disease Control] data. We’ll talk about that once we release it. We’re finding that it’s corroborating what we saw in the UK, especially among younger people where cancers are not supposed to happen.’

‘We do agree there are co-factors and not necessarily every excess death is attributable to the vaccine. But there’s enough evidence to suggest that a lot of the damage we saw is

correlated to the vaccine.

‘We’ve tracked excess mortality in many different countries: UK, all of Europe, Australia, Ireland, Germany, but not Canada because their death data seems to be lagging quite a bit. But in country after country where excess deaths occurred, it was very well correlated to vaccination uptake. There seems to be a pattern.

‘There’s a signal indicating that something has happened. At the very least, it needs to be investigated, and it should send alarm bells throughout the health world.’

On top of deaths and acknowledged disabilities, there has been huge increase in time taken off work in the US, categorised by the analysts as ‘injury’ data and currently estimated at about 28million Americans. (Sickness absence rates have also [soared in the UK](#).)

The category includes anything that might cause you to miss work more than usual, including vaccine side-effects such as tinnitus or reduced resistance to infections. The figure shot up ‘incredibly’ in 2020, Dowd said, because of the lockdowns, but it continued into 2021 at about the same rate, and then took off again in 2022. It has come back down in 2023, but is still way over past trends.

‘We should really measure how well the authorities did. If it was a success and the vaccines worked, excess mortality should have really started coming down in 2021 and continued down in 2022. Disabilities, which only started in 2021, should never exist at all.’

Yet in the years 2021-23, 1,100,000 Americans perished above and beyond the normal rate. ‘If you include Covid, about 1.55 million people died in the US with the combined Covid lockdowns and vaccination solutions. There were about three-and-a-half million excess disabilities, all of them starting in 2020. The pandemic scorecard is a fail.’
