

Pfizer's own study shows their COVID vaccines increase your risk of serious adverse events (up to 71% higher)

The full study results were obtained via a FOIA request because Pfizer and the health authorities won't voluntarily disclose it. You're about to find out why.

Executive summary

Normally, when Pfizer’s own study shows their vaccines increase your risk of serious adverse events and those effects are both large and statistically significant, you would think that would be reported by *The New York Times*, right?

But for some reason, which I still can’t figure out, they missed it. Again.

So it’s up to your friendly neighborhood misinformation spreaders (such as myself) bring this to your attention.

The Pfizer study results (CONFIDENTIAL)

Interim Report 5 of the Pfizer Post-Authorization Safety Study (PASS) aka Post Conditional Approval Active Surveillance Study Among Individuals in Europe Receiving the Pfizer-BioNTech Coronavirus Disease 2019 (COVID-19) Vaccine.

[Full study](#)

This is marked **Pfizer Confidential** so it's important that you don't tell anyone. We save lives by keeping this quiet, apparently.

This is marked **Pfizer Confidential** so it's important that you don't tell anyone. We save lives by keeping this quiet, apparently.

What the study said

The study compared vaccinated people vs. matched unvaxxed controls at 6 different sites and looked at 37 AESIs in more than 12 million vaccinated individuals and 12 million matched unvaccinated controls.

Table 16 of the full study summaries the findings.

First of all, you should note that the **unvaccinated are in general far less healthy and die at over 2X the rate that the vaccinated do** (see the Deaths (any causes) and Sudden death lines).

So when we look at hazard ratios between vaccinated and unvaccinated and find that they are the same or higher (i.e., ≥ 1), we should be VERY concerned.

Note: The lower death rate of the vaccinated is selection bias: vaccinated people generally more health conscious and have higher socio-economic status. It has nothing to do with the COVID vaccine saving lives (there is no plausible mechanism of action causing lower death rates; if there was, I'd be the first one to get my shots).

From Table 16, I note the following statistically significant increases:

1. Acute aseptic arthritis: 1.23 (1.11, 1.35)
2. Diabetes mellitus type 1: 1.21 (1.02, 1.45)

3. Acute cardiovascular injury including microangiopathy: 1.38 (1.31, 1.45)
4. Arrhythmia: 1.36 (1.29, 1.44)
5. Heart failure: 1.29 (1.13, 1.47)
6. Coronary artery disease: **1.49** (1.31, 1.69)
7. Myocarditis (7 days): 9.70 (1.24, 75.97) [it may be higher than this but they censor counts <5 to protect privacy because if it was known 1 person got it, everyone would know who it was).
8. Myocarditis or pericarditis (21 days): 1.68 (1.06, 2.66)
9. Secondary amenorrhoea: **1.71** (1.34, 2.18)
10. Hypermenorrhea: 1.40 (1.23, 1.60)
11. Anaphylaxis: 31.95 (7.82, 130.52)

Other articles about the study

Big thank you to Nick Hunt for bringing this to my attention.

Here are Nick's excellent articles with amazing graphs that Pfizer doesn't show you

Summary

No matter how bad the COVID vaccine data is, it's nice to know that there is one thing that we can all always rely on: they will cover it up in order to protect the drug companies.

My Covid-vaccinated colleague and friend died of cardiac arrest at age 46 while on vacation in C He had no prior known heart conditions and seemed perfectly healthy and fit except for Type 1 Diabetes. They flew him back to Dallas on life support to give his 4 boys a chance to say their goodbyes. His wife asked twice for an autopsy, but the doctors refused. They said they already knew how he died (cardiac arrest) but clearly they weren't curious about any underlying conditions. I am dumbfounded. Do you think it's possible doctors don't want to know how frequently the Covid vaccine is or could be the cause of heart attacks?

"No matter how bad the COVID vaccine data is, it's nice to know that there is one thing that we can always rely on: they will cover it up in order to protect the drug companies."

This cover up is a direct result of allowing drug companies to advertise. In the seventies, reporters actually did question the swine flu vaccine. You know why? Because at that time, drug companies were not allowed to advertise. There was no financial incentive to hide the truth.

As long as it is lawful for them to advertise, they control the media. It isn't any more complicated than that.
